## WELL MEASURING LINE – CORROSION RESISTANCE, MECHANICAL PROPERTIES

### 1) Corrosion resistance --Pitting and Crevice.

Performance of various alloys is often measured using Critical Pitting Temperatures [CPT], Critical Crevice Temperatures [CCT] and **Pitting Resistance equivalent Numbers [PREN]** The corrosion resistance of stainless steel is basically dependent on their chemical compositions.

The PREN is determined by a calculation based on the chromium, molybdenum, and nitrogen contents.

$$PREN = \%CR + (3.3 \times \%Mo) + (30 \times \%N)$$

As a general rule, the higher the PREN, the better the resistance to pitting. However, alloys having similar values may differ considerably in actual service. Those with values greater than 38 on the PREN scale offer more corrosion resistance than austenitic stainless steels.

The **Critical Pitting Temperature [CPT]** test involves exposing sample to a solution of ferric chloride solution. The **Critical Crevice Temperature [CCT]** involves exposing samples to the same test solution as above except accelerated by devices. i.e. TFE-fluorocarbon washer.

Table 1- Pitting Resistance Equivalent Numbers  
 (%CR+(3.3 x %Mo) + (30 x %N))

ALLOY	Cr %	Mo %	N %	PREN
304	19	--	--	19
316	17	2.5	--	25
2205	22	3.0	0.15	31
25-6Mo	20	6.5	0.20	36
Inconel 625	21	9.0	.15	55
Hastelloy C-276	15	16	.15	72
Nitronic 50	22	2.25	.30	38

Table 2- Critical Crevice Temperatures [CCT]  
 Critical Pitting Temperature [CPT]  
 6% Ferric Chloride Solution

ALLOY	CCT		CPT	
	°C	°F	°C	°F
Hastelloy C-276				
Inconel 625	30-35	86-95	>85	>185
25-6 Mo	30-35	86-95	70	158
2205				
316	<0	<32	20	68
304	<0	<32	15	59
